

Complaint Risk & SLA Analytics

Where is complaint risk building, and are we responding on time?

From raw complaints to ranked decisions

An end-to-end analysis of 62,516 consumer financial complaints (May 2017 to Aug 2023), built with Python, PostgreSQL and Power BI, and written for a Risk and Compliance audience.

Item	Detail
Prepared by	Seema Kumari, Data Analyst
Date	October 2026
Audience	Head of Risk, Compliance, Operations and Product leads
Data source	Public CFPB Consumer Complaint Database, via Maven Analytics Data Playground
Tools	Python (pandas), PostgreSQL, Power BI (DAX)
Companion files	Notebook, six SQL files, Power BI report (3 pages), this document

How to read this report

Sections 01 to 03 set up the problem. Sections 04 to 08 show the work and the evidence. Sections 09 to 12 turn it into decisions. Sections 13 to 15 cover limits, the conclusion and the technical detail. If you only have five minutes, read Section 01 and Section 10.

Contents

No.	Section	What it covers
01	Executive summary	The answer in one page
02	Business problem	Why complaint data goes unused
03	Objectives and business questions	What we set out to answer
04	Dataset understanding	What the data is, and is not
05	Data cleaning	From raw records to analysis-ready
06	Exploratory analysis	Volume, products, issues, states, channels
07	KPI analysis	SLA, relief and the five-percent test
08	Business question analysis	One answer per question, plus the July spike
09	Key insights	Seven findings and four corrections
10	Recommendations	Six ranked decisions and a 90-day plan
11	Power BI dashboard	Three pages, one story
12	Business impact	What is at stake, and how to measure it
13	Limitations	What this analysis cannot tell us
14	Conclusion	The short version
15	Technical appendix	Architecture, SQL, DAX, data dictionary, how to run

01 Executive summary

A bank receives thousands of consumer complaints. Each one is a small signal about a product that is confusing, a process that is broken, or a deadline that was missed. Left as raw records, those signals never reach the people who can act on them. This project turns 62,516 complaints into a short list of decisions.

The headline is reassuring. The detail is not. Overall, 96.06% of closed complaints were answered on time and only 3.94% were late, inside an assumed 5% target. But that average hides three things: volume has doubled, most of the cost sits in two products, and the late rate was far above target in 2021 and again in 2023.

Complaints 62,516 May 2017 to Aug 2023	Timely rate 96.06% of 61,022 closed	Late rate 3.94% assumed target: 5%	Monetary relief 24.08% of closed complaints	Products over 5% 3 full period
---	--	---	--	---

What we found

- **Volume has doubled.** January to August complaints rose from 4,546 (2019) to 9,131 (2023), up 9.4% on 2022.
- **Two products drive the load.** Checking & Savings and Credit/Prepaid Card are 65.6% of complaints and about 87% of monetary relief.
- **The late rate hides a breach.** 10.98% in 2021, 4.38% in 2022, 6.84% in 2023 (Jan to Aug). Six of seven main products exceeded 5% in both 2021 and 2023. Mortgage did not.
- **The causes are specific.** 83.77% of Checking & Savings complaints concern managing, closing or opening an account. 56.50% of Money Transfer complaints are fraud or scams.
- **Geography is concentrated.** CA, FL, TX and NY hold 46.9% of complaints (raw counts, not per capita).

What we recommend

Six ranked decisions (Section 10). Three need no new tooling: focus resources on the two main products, track SLA per product, and plan capacity for growth. Three need scoping with Risk and Product: an account-management audit, a fraud-monitoring case for Money Transfer, and an investigation of the 2021 and 2023 spikes.

One caution

The 5% SLA target is an assumption, not a regulatory rule. Confirm the real internal target with Compliance before acting on the breach findings.

02 Business problem

Financial institutions handle complaints across many products, states and channels. Regulators such as the CFPB expect timely responses, and every complaint that ends in monetary relief is a direct cost. Yet complaint records usually sit in an operational system, read one at a time, and rarely studied as a whole. Without structured analytics, four things stay invisible: where the pain is, where the risk is, whether responses are on time, and what to fix first.

The core question

Which products, issues and periods carry the highest risk, and is the organisation responding on time?

	Without this analysis	With this analysis
Visibility of risk	Complaints read one by one	Ranked by product, issue, state and year
Response performance	One company-wide late rate	Late rate per product and year, against a target
Cost of complaints	Unknown	Monetary relief rate per product as a cost proxy
Prioritisation	Based on volume of noise	Six ranked decisions with evidence and owners

03 Objectives and business questions

Objectives: clean and validate the data so every number can be trusted; measure volume, product mix, causes, geography and channels; measure SLA performance honestly against a clear target; estimate where remediation cost concentrates; present the story in a three-page dashboard; and convert findings into ranked, owned decisions.

Business questions

1. Which products generate the most complaints and the highest risk?
2. Which issues are the root causes?
3. What is the SLA breach rate overall, by product and over time?
4. Which states and channels carry the most complaints?
5. What share of complaints ends in relief?
6. How does volume trend, and is there seasonality?

The answers are in Section 08. **Success looks like:** every headline figure reconciles across Python, SQL and Power BI; every finding is a decision with evidence, owner and effort; every limit is stated on the page.

04 Dataset understanding

The data is the public CFPB Consumer Complaint Database, in the form published by Maven Analytics for learning and portfolio use. It is a public record, not an internal bank log. Each row is one complaint, with 12 raw columns: complaint ID, channel, date submitted, date received, state, product, sub-product, issue, sub-issue, company public response, company response to consumer, and timely response (full dictionary in Appendix E).

Property	Value	Property	Value
Rows	62,516	Period	1 May 2017 to 28 Aug 2023
States	51 (50 plus DC)	Products	9
Channels	7	Closed complaints	61,022
In progress	1,494	Raw columns	12

What the data does not contain

No company name, so no peer benchmark. No complaint narrative, so no text mining. No consumer-disputed flag or ZIP code. No state population, so state counts cannot become rates per head. These gaps shape the limits in Section 13.

05 Data cleaning

Cleaning was done in a Python notebook (pandas), step by step, with a check after each step.

#	Step	Result
1	Loaded the raw Excel file	62,516 rows, 12 columns
2	Inspected types, nulls and duplicates	0 duplicate IDs, 0 fully duplicate rows
3	Renamed columns to snake_case	First column `a` became `complaint_id`
4	Filled missing text with labels	sub_product (7), sub_issue (10,858), public response (2,175)
5	Trimmed text, upper-cased state codes	51 distinct states
6	Checked dates	Both already dates; 0 negative intake lags
7	Engineered 13 new columns	Time fields, intake lag, SLA flags, relief flags, short product name
8	Saved the clean file	62,516 rows, 25 columns, ready for PostgreSQL

The decision that matters most: blank is not late. 1,494 complaints have no timely-response value. Checking the company response showed **all 1,494 are "In progress"**. They are not late; they are not finished. So timely, late and relief rates use closed complaints only (61,022). This choice moves the headline figures and corrected an earlier draft (Section 09).

Do the three tools agree? Row counts, nulls, duplicates and flag totals were checked in the notebook, and eleven validation queries were run in SQL. The headline KPIs were then rebuilt in PostgreSQL and Power BI.

Metric	Python	SQL	Power BI	Match
Total complaints	62,516	62,516	62,516	Yes
Closed complaints	61,022	61,022	61,022	Yes
Late complaints	2,403	2,403	2,403	Yes
Late rate (closed)	3.94%	3.94%	3.94%	Yes
Timely rate (closed)	96.06%	96.06%	96.06%	Yes
Monetary relief rate (closed)	24.08%	24.08%	24.08%	Yes

06 Exploratory analysis

6.1 Volume and trend

2017 starts in May and 2023 ends in August, so a calendar-year comparison would be unfair. The like-for-like view is January to August.

Figure 1. Complaints filed January to August, 2018 to 2023

Volume dipped in 2019, then grew every year. 2023 (9,131) is double 2019 (4,546) and 9.4% above 2022 (8,350). It is **not** declining; that impression came from comparing a partial 2023 with full years. Full-year totals: 2017* 5,394, 2018 7,872, 2019 7,075, 2020 8,942, 2021 11,149, 2022 12,953 (*May to December).

6.2 Product mix

Figure 2. Share of complaints by product

Checking & Savings (24,814 complaints) and Credit/Prepaid Card (16,197) make up **65.6%**. Credit Reporting and Mortgage add another 22.9%. Student Loan has only 39 complaints, too few to read anything into.

6.3 Root causes

Figure 3. Top 10 issues

"Managing an account" alone is 15,109 complaints, 24.2% of everything. Inside the three biggest products the causes sharpen:

Product	Top issue	Share of product	Next issues
Checking & Savings	Managing an account	60.89%	Closing 11.90%, Opening 10.98%
Credit/Prepaid Card	Problem with a purchase on the statement	27.26%	Getting a card 11.53%
Money Transfer	Fraud or scam	56.50%	Other transaction problem 16.54%

Managing, closing and opening an account together are **83.77%** of Checking & Savings complaints. That points to the whole account lifecycle, not one broken feature.

6.4 Geography and channels

State	Count	State	Count	State	Count	State	Count
CA	13,709	GA	2,921	MA	2,141	VA	1,731
FL	6,488	NJ	2,664	MD	1,959		
TX	4,686	IL	2,270	NY	4,442		

California, Florida, Texas and New York hold **46.91%** of complaints, and California has 2.11 times as many as Florida. These are raw counts, so this is a volume ranking, not a risk score.

Channel	Complaints	Share	Late rate (closed)
Web	45,423	72.66%	4.34%
Referral	10,766	17.22%	2.62%
Phone	4,684	7.49%	3.78%
Postal mail	1,318	2.11%	2.14%
Fax / Web Referral / Email	233 / 90 / 2	0.51%	Too few to compare

Web is the dominant channel and has the highest late rate among the large channels, so a self-service fix for account management would reach most complainants directly.

6.5 Seasonality and intake lag

Using full years only (2018 to 2022), the quarters share complaints almost evenly: Q1 23.58%, Q2 24.93%, Q3 25.95%, Q4 25.54%. The spread is 2.4 points, so **seasonality is weak**. Intake lag is usually zero days (median 0); only 435 complaints took more than 30 days (maximum 275), so the median is the right summary.

07 KPI analysis

KPI	Formula	Value	Base
Total complaints	Count of rows	62,516	All
Closed complaints	Total minus in progress	61,022	All
Timely rate	Timely divided by closed	96.06%	Closed
Late rate (SLA breach)	Late divided by closed	3.94%	Closed
Any relief rate	Complaints with any relief divided by closed	32.73%	Closed
Monetary relief rate	Complaints with monetary relief divided by closed	24.08%	Closed
Median intake lag	Median of received minus submitted	0 days	All

7.1 SLA by product

Figure 4. Late rate by product (closed complaints). Red = above the 5% assumed target

Debt Collection (6.44% of 2,687 closed), Credit Reporting (6.32% of 7,520) and Vehicle Loan (5.35% of 617) are above 5%. Credit/Prepaid Card (4.36%), Money Transfer (4.14%) and Checking & Savings (3.60%) are inside it, and Mortgage is just 0.24%. The overall 3.94% sits comfortably under 5%, which is why SLA should be tracked per product.

7.2 SLA over time

Figure 5. Late rate by year (closed complaints). 2023 is January to August

The late rate was almost zero from 2017 to 2019 (0.10% to 0.17%), 0.69% in 2020, then jumped to **10.98% in 2021**, eased to 4.38% in 2022 and rose again to **6.84% in 2023**. Rates before 2020 are so low that they may reflect how timeliness was reported then, so read the 2021 jump with care.

7.3 Product by year

Late rate by product and year (closed complaints, small products excluded). Shaded cells are above 5%.

Product	2017	2018	2019	2020	2021	2022	2023
Checking & Savings	0.1%	0.3%	0.1%	0.5%	7.8%	5.1%	7.6%
Credit Reporting	0.2%	0.0%	0.2%	0.5%	18.6%	4.0%	7.9%
Credit/Prepaid Card	0.3%	0.1%	0.2%	1.2%	12.6%	4.2%	6.0%
Debt Collection	0.0%	0.0%	0.0%	0.8%	19.5%	5.2%	7.7%
Money Transfer	0.7%	0.3%	0.0%	0.5%	10.4%	4.2%	5.8%
Mortgage	0.2%	0.1%	0.0%	0.3%	0.4%	0.3%	1.0%
Vehicle Loan	0.0%	0.0%	0.0%	1.0%	11.5%	10.2%	7.1%

Six of seven products breached 5% in 2021, and six of seven again in 2023. Only Mortgage stayed under in both years. Vehicle Loan breached three years running (11.5%, 10.2%, 7.1%). Because almost every product moved together, the cause looks company-wide (capacity, process or reporting), not product-specific. The data cannot say which.

7.4 Relief by product

Figure 6. Monetary relief rate by product (closed complaints)

Checking & Savings (33.30%) and Credit/Prepaid Card (30.40%) have the highest monetary relief rates and, being the largest products, about **87%** of all 14,697 monetary relief outcomes. Credit Reporting has high volume but a low relief rate (3.63%): a volume problem, not a cost problem. Money Transfer is third (18.74%).

08 Business question analysis

Question	Answer	Evidence	So what
Q1. Which products carry the most risk?	Checking & Savings and Credit/Prepaid Card	65.6% of complaints; about 87% of monetary relief; relief rates 33.30% and 30.40%	Focus tooling and staffing here first
Q2. What are the root causes?	Account lifecycle problems; fraud in Money Transfer	"Managing an account" 15,109 (24.2%). Checking: manage, close, open 83.77%. Money Transfer fraud 56.50%	Audit the account process; scope fraud monitoring
Q3. Are we responding on time?	On average yes, in detail no	3.94% late overall; 3 products above 5%; 10.98% in 2021; 6.84% in 2023; 6 of 7 products breached in both years	Track SLA per product monthly; investigate 2021 and 2023
Q4. Which states and channels?	CA, FL, TX, NY and Web	Top four states 46.91%; CA is 2.11 times FL; Web 72.66%	Rank states per capita first; fix the web self-service path
Q5. How much ends in relief?	One in three closed complaints	32.73% any relief; 24.08% monetary (14,697 outcomes)	Treat monetary relief as the cost signal to reduce
Q6. Trend and seasonality?	Strong growth, weak seasonality	Jan to Aug: 4,546 (2019) to 9,131 (2023); quarters 23.58% to 25.95%	Plan capacity for growth, not seasons

8.7 Follow-up: the July 2023 spike

The monthly trend showed a spike in July 2023 and a drop in August. Before presenting it, we checked it.

Figure 7. Monthly complaints in 2023. *August is partial (data ends 28 Aug)

- **Size.** July had 1,749 complaints, 57% above the January to June average of about 1,111.
- **Timing.** Five days (11 to 15 July) hold 618 complaints, 35% of the month, peaking at 183 on 12 July. A normal day is closer to 37.
- **Product.** Checking & Savings had 883 (50.5%) and Credit/Prepaid Card 483 (27.6%).
- **August.** 717 complaints, but only 28 days of August are in the data, and even scaled up it sits below normal.

Status: flagged, cause unconfirmed

A short burst led by Checking & Savings, not a data-loading artifact. The data cannot say whether it was an outage, a fee change or something else. Recommended: Operations reviews 11 to 15 July 2023.

09 Key insights

#	Insight	Evidence	Why it matters
1	Two products carry two-thirds of the load	65.6% of complaints; about 87% of monetary relief	Where effort pays off most
2	Account management is the biggest issue	15,109 complaints; 83.77% of Checking & Savings	A fixable process problem
3	Fraud defines Money Transfer	56.50% of its complaints	A targeted monitoring case
4	The overall late rate hides a breach	3.94% overall; 3 products above 5%	Company-wide averages mislead
5	SLA deteriorated in 2021 and again in 2023	10.98% in 2021; 6.84% in 2023; 6 of 7 products in both	Looks systemic; needs investigation
6	Volume is growing, not seasonal	Jan to Aug doubled since 2019; quarters 23.6% to 25.9%	Capacity, not seasonal staffing
7	Web is the main door	72.66% of submissions; late rate 4.34%	Self-service reaches most people

Where this analysis corrected an earlier draft

Earlier claim	Corrected	Why
Late rate 3.84%, timely rate 93.77%	3.94% and 96.06%	Divided by all complaints; the 1,494 in-progress ones are neither late nor timely yet
"2023 is declining"	Up 9.4% on 2022 (Jan to Aug)	2023 only has January to August
Q2 and Q3 hold 53% of complaints	50.88%; spread is only 2.4 points	The missing Q4 of 2023 inflated the share
60%+ of checking complaints are account friction	83.77%	Managing, closing and opening were counted separately

10 Recommendations

Each finding is a ranked decision with evidence, an owner and an effort level. "Needs scoping" means a conversation with Risk and Product is needed before committing, because the work carries cost beyond this analysis.

#	Decision	Evidence	Owner	Effort	Scoping
1	Focus staffing and tooling on Checking & Savings and Credit/Prepaid Card	65.6% of complaints; about 87% of monetary relief	Operations	Low	No
2	Audit the account-management process	83.77% of Checking & Savings complaints are managing, closing or opening an account	Product	Medium	Yes
3	Scope fraud monitoring for Money Transfer	Fraud or scam is 56.50% of its complaints	Risk	High	Yes
4	Track SLA per product, every month	Debt Collection 6.44%, Credit Reporting 6.32%, Vehicle Loan 5.35% against an assumed 5% target	Compliance	Low	No
5	Investigate the 2021 spike and the 2023 rebound	10.98% in 2021, 4.38% in 2022, 6.84% in 2023; 6 of 7 products breached in both years	Compliance	Medium	Yes
6	Plan capacity for growth, not seasonality	Jan to Aug volume up 9.4% in 2023; quarters 23.6% to 25.9%	Operations	Low	No

90-day plan

When	Actions	Outcome
Days 0 to 30	Decisions 1, 4, 6. Confirm the real SLA target with Compliance. Review the 11 to 15 July 2023 burst.	Per-product SLA monitor live; resources aligned to two main products
Days 30 to 60	Scope decisions 2, 3, 5 with Risk and Product. Pull the 2021 late complaints.	Scoped cases with cost and owner
Days 60 to 90	Start the account-management audit. Rank states per capita with population data.	Audit under way; fair regional view

How we would know it worked (proposed, to agree with the business): every product at or below the agreed SLA target for three months in a row; the account-management share of Checking & Savings complaints falling from 83.77%; monetary relief rates for the two main products falling from 33.30% and 30.40%; late-rate spikes caught in the month they happen.

11 Power BI dashboard

Three pages follow the story: **how big and where, why and are we on time, what to do**. Every number ties to the SQL layer. Red means risk and nothing else (breaches only), titles say what a chart is and subtitles say what to take from it, and slicers are synced across pages.

Page 1. Executive Overview: how big is it, and where?

Page 2. Root Cause & SLA Monitor: why, and are we on time?

Page 3. Decisions & Action Plan: what do we do?

12 Business impact

This analysis does not claim a money saving, because the data has no internal cost figures (cost per complaint, relief amounts, staffing cost). It shows where value sits and gives the business a way to measure it.

- **14,697** complaints ended in monetary relief (24.08% of closed complaints). Each is a direct cost.
- **2,403** responses were late. Each is a compliance exposure.
- **65.6%** of complaints sit in two products, so a small improvement there has a large effect.

With internal data, value can be estimated as **(complaints avoided) x (cost per complaint) + (monetary relief avoided)**. A first step is to ask Finance for the average handling cost and average relief amount for Checking & Savings and Credit/Prepaid Card.

Honest note

Complaints "avoided" depend on fixing root causes. This analysis shows where the causes are, not that a fix will work. Measure impact after changes, using the measures in Section 10.

13 Limitations

Limitation	Effect on the findings	What would address it
Public CFPB data, not an internal bank log	Findings describe a market sample, not one institution	Re-run on internal complaint data
The 5% SLA target is assumed	Which products count as in breach depends on it	Confirm the real target with Compliance
Late rates before 2020 are near zero	May reflect reporting practice; read the 2021 jump with care	Check how timeliness was recorded over time
2017 and 2023 are partial years	Calendar-year comparisons would mislead	Used January to August and full-year views
State counts are raw	Large states rank high by size alone	Add population and rank per capita

Limitation	Effect on the findings	What would address it
Small products (Student Loan 39, Payday/Personal Loan 333, Vehicle Loan 633 complaints)	Rates are unstable	Not ranked; flagged in the dashboard
No company, narrative, dispute or ZIP data	No peer benchmark or text analysis	Use the full CFPB export
The July 2023 burst is unexplained	Could be a real event or a recording effect	Operations review of 11 to 15 July

14 Conclusion

The question was simple: which products, issues and periods carry the highest risk, and are we responding on time? The honest answer is that **on average we are, and in the detail we are not.**

A late rate of 3.94% looks safe. Underneath it, volume has doubled, two products carry two-thirds of the complaints and almost nine-tenths of the monetary relief, and six of seven products breached a 5% response target in both 2021 and 2023. The causes are concrete: account management in Checking & Savings, and fraud in Money Transfer.

Three decisions can start tomorrow with no new tooling. Three need scoping with Risk and Product. And because the figures reconcile across Python, SQL and Power BI, the conversation can be about what to do rather than whether the numbers are right.

Next: confirm the real SLA target with Compliance; add population data and rank states per capita; pull the 2021 late complaints and the July 2023 burst to find causes; re-run on internal data with company and narrative fields.

15 Technical appendix

A. Architecture

Figure 8. From raw data to decisions

Python (pandas, matplotlib, Jupyter) cleans, engineers features, validates and explores. PostgreSQL holds one table, the KPI queries, window functions and a reporting view. Power BI (DAX, Import mode) connects to that view.

B. Repository structure

```

complaint-risk-sla-analytics/
├── data/raw/ and data/processed/  Consumer_Complaints.xlsx, complaints_clean.csv
├── notebooks/                    Complaint_Risk.ipynb
├── sql/                          01 to 06 (below)
├── powerbi/                      .pbix, measures.dax, theme .json
├── dashboard/                   page screenshots
├── reports/                     this report
└── README.md
  
```

C. SQL files

File	Purpose	Techniques
01_create_table.sql	Creates the complaints table (25 columns)	DDL, primary key
02_data_validation.sql	Eleven checks: counts, nulls, dates, flags, lag	Aggregates, CASE
03_kpi_queries.sql	Headline KPIs, product share, issues, late rate by product and year	GROUP BY, SUM() OVER
04_advanced_analysis.sql	Product risk rank, monthly trend, product by year	CTE, DENSE_RANK, LAG, rolling AVG
05_powerbi_views.sql	Clean view for Power BI (vw_complaints_bi)	VIEW
06_spike_investigation.sql	July 2023 spike: months, days, products	Filters, ranking

D. Key DAX measures

Total Complaints = COUNTROWS(vw_complaints_bi)

Closed Complaints = [Total Complaints] - [In Progress]

Late Rate % = DIVIDE([Late Complaints], [Closed Complaints])

Timely Rate % = DIVIDE(SUM(is_timely), [Closed Complaints])

Monetary Relief Rate % = DIVIDE(SUM(has_monetary_relief), [Closed Complaints])

SLA Target = 0.05

Products Above Target = COUNTROWS(FILTER(VALUES(product), [Late Rate %] > [SLA Target]))

Late Color = IF([Late Rate %] > [SLA Target], red, blue)

E. Data dictionary (clean file, 25 columns)

Column	Type	Meaning
complaint_id	integer	Unique complaint number
channel, state	text	Submission channel; US state code
date_submitted, date_received	date	Filed and received dates
product, product_short, sub_product	text	Product, short label and sub-product
issue, sub_issue	text	What went wrong
company_public_response, company_response, timely_response	text	Public statement; outcome; Yes, No or blank if in progress
year, quarter, month, month_name, year_month, intake_lag_days	number / text	Time dimensions; days from submitted to received
is_in_progress, is_timely, is_late	0 or 1	SLA flags
has_monetary_relief, has_non_monetary_relief, has_any_relief	0 or 1	Relief flags

F. How to reproduce

1. Put Consumer_Complaints.xlsx in the notebook folder and run the notebook top to bottom. The KPI cell should print 62,516 total, 61,022 closed and a late rate of 3.94%.
2. Create the database, run 01_create_table.sql inside it, then import complaints_clean.csv (header on).
3. Run 02_data_validation.sql and confirm 62,516 rows, 1,494 in progress, 2,403 late.
4. Run 03 to 06. Run 05 before opening Power BI.
5. In Power BI, connect to PostgreSQL (localhost, complaint_analytics, Import), load vw_complaints_bi, add the measures and apply the theme.
